In compiler optimization, register allocation is the process of assigning a large number of target program variables onto a small number of CPU registers.. Register allocation can happen over a basic block (local register allocation), over a whole function/procedure (global register allocation), or across function boundaries traversed via call-graph (interprocedural register allocation).

1 Introduction. Extensible Markup Language, abbreviated XML, describes a class of data objects called XML documents and partially describes the behavior of computer programs which process them. XML is an application profile or restricted form of SGML, the Standard Generalized Markup Language .By construction, XML documents are conforming SGML documents.
