In response to DNA damage and replication blocks, cells prevent cell cycle progression through the control of critical cell cycle regulators. To investigate checkpoint conservation, Matsuoka et al. (1998) used PCR and database analysis to identify CHK2, the mammalian homolog of *Saccharomyces cerevisiae* Rad53 and *Schizosaccharomyces pombe* cds1+, protein kinases required for DNA damage and ...

Epigenetics is the study of heritable phenotype changes that do not involve alterations in the DNA sequence. The Greek prefix epi-(ἐπι-"over, outside of, around") in epigenetics implies features that are "on top of" or "in addition to" the traditional genetic basis for inheritance. Epigenetics most often denotes changes that affect gene activity and expression, but can also be used to ...

The history of the discovery of the structure of DNA is a classic example of the elements of the scientific method: in 1950 it was known that genetic inheritance had a mathematical description, starting with the studies of Gregor Mendel, and that DNA contained genetic information (Oswald Avery's transforming principle). But the mechanism of storing genetic information (i.e., genes) in DNA was ...

HERC2 shuttles between the nucleus and cytoplasm and functions as an E3 ubiquitin ligase for the ubiquitination and degradation of target proteins (Wu et al., 2010), as an activator of other E3 ubiquitin ligases (Kuhnle et al., 2011), and as an adaptor for assembly of DNA damage response proteins (Bekker-Jensen et al., 2010). For background information on the HERC gene family, see HERC1 ().

Searching for Answers in the DNA. In theory, a genetic marker can be any type of biomolecule or assay that allows us to “read” inherited differences among individuals in their DNA sequences. Blood groups, protein isozymes, and human leukocyte antigens (HLAs) were among the first developed markers, but even simple traits that are controlled by single genes (e.g., eye color) can also serve ...
