Work Power Energy Exam2 and Problem Solutions 1. Applied force vs. position graph of an object is given below. Find the kinetic energy gained by the object at distance 12m. By using work and energy theorem we say that; area under the graph gives us work done by the force. $\Delta EK = W = \text{area under the graph} = (8+4)/2 \cdot 8 = 8(12-8)$ $\Delta EK = 12 \cdot 4 = 48$ joule 2.

If an object of mass $m = \text{kg}$ is dropped from height $h = \text{m}$, then the velocity just before impact is $v = \text{m/s}$. The kinetic energy just before impact is equal to its gravitational potential energy at the height from which it was dropped: $K.E. = J$. But this alone does not permit us to calculate the force of impact!

The ratio of electric potential energy per unit charge is therefore a property of the electric field and is called the field's electric potential, or voltage (volt = joule/coulomb). If you were to connect together a series of positions having the same voltage you would produce an equipotential surface. Electric potential is a scalar quantity.
