Rational expressions are like fractions, but instead of integers in the numerator and the denominator, you have variable expressions! Learn how to work with such expressions. Namely, simplify, add, subtract, multiply, and divide them (much like fractions!). Then, solve some equations with rational expressions in them, and analyze the behavior of rational functions.

So variation equations may have complicated expressions, but they'll only ever have the one term. Their equations will never have two or more terms added together. For instance,  $y = 3x$  is a variation equation, but  $y = 3x + 2$  is not. An example of a variation equation would be the formula for the area of the circle:

It could be  $y$  is equal to  $1/x$ . It could be  $y$  is equal to 2 times  $1/x$ , which is clearly the same thing as  $2/x$ . It could be  $y$  is equal to  $1/3$  times  $1/x$ , which is the same thing as  $1$  over  $3x$ . it could be  $y$  is equal to negative 2 over  $x$ . And let's explore this, the inverse variation, the same way that we explored the direct variation.
