### Chem4Kids.com: Reactions: Overview

What is a chemical reaction? A chemical reaction is the change of a substance into a new one that has a different chemical identity.. How can I tell if a chemical reaction is occurring? A chemical reaction is usually accompanied by easily observed physical effects, such as the emission of heat and light, the formation of a precipitate, the evolution of gas, or a color change.

A chemical reaction is a process that leads to the chemical transformation of one set of chemical substances to another. Classically, chemical reactions encompass changes that only involve the positions of electrons in the forming and breaking of chemical bonds between atoms, with no change to the nuclei (no change to the elements present), and can often be described by a chemical equation.

In a chemical reaction, chemical equilibrium is the state in which both reactants and products are present in concentrations which have no further tendency to change with time, so that there is no observable change in the properties of the system. Usually, this state results when the forward reaction proceeds at the same rate as the reverse reaction. ...

### Chemical equilibrium - Wikipedia

A chemical reaction is a process generally characterized by a chemical change in which the starting materials (reactants) are different from the products. Chemical reactions tend to involve the motion of electrons, leading to the formation and breaking of chemical bonds. There are several different types of chemical reactions and more than one way of classifying them.

The Rates of Chemical Reactions Page 2-5  $\text{H}_2 + \text{Br}_2 \rightarrow 2\text{HBr}$  (2.4)  $\frac{1}{2} \frac{d[\text{HBr}]}{dt} = k[\text{H}_2][\text{Br}_2]^{1/2}$  (2.5)

When the rate law can be written in this simple way, we define the overall order of the reaction as the sum of the powers, i.e., overall order  $q = m+n+o+p$ , and we define the order of the reaction with respect to a particular species as the power to which its concentration is
