R f values are calculated by looking at the distance each component travels on the chromatography paper compared to the distance traveled by the solvent front. This ratio will be different for each component due to its unique chemical properties. When measuring the distance the component traveled, you should measure from the origin (where the middle of the spot originally was) and then to the ...

With Excel interop, a lot of the time a return value will be in the form of an Object so you need to cast to the correct type to get it's actual properties.. So do something like this (my VB is rusty so may not be completely correct)...

VB.net Excel.worksheet().cells().Value - Stack Overflow

I was watching a tutorial for comparing two excel worksheets and came across this:. cellVal1 = ws1.Cells(row, col).Formula In the video he says that this assigns the value of the specified cell to the cellVal1.I've only seen people use ws.Cells(row, col).Value and can't seem to find anything about .Formula with regards to .Cells(<row>,<col>). What does .Formula do and is it different than .Value?
