A temperature gradient is a physical quantity that describes in which direction and at what rate the temperature changes the most rapidly around a particular location. The temperature gradient is a dimensional quantity expressed in units of degrees (on a particular temperature scale) per unit length. The SI unit is kelvin per meter (K/m). It can be found in the formula for dQ/dt , the rate of ...

In meteorology, an inversion, also known as a temperature inversion, is a deviation from the normal change of an atmospheric property with altitude. It almost always refers to an inversion of the thermal lapse rate. Normally, air temperature decreases with an increase in altitude. During an inversion, warmer air is held above cooler air; the normal temperature profile with altitude is inverted.

The workings: thermal equilibrium for an Earth without an atmosphere: The sun behaves approximately like a black body of radius $r_s = 6.599 \times 10^5$ Km, at a temperature of $T_s = 5,783$ K. The radiative flux at the sun's surface is given by the expression σT_s^4 , where σ is the Stefan-Boltzmann Constant (5.6704×10^{-8} Wm⁻² K⁻⁴). Flux refers to radiation per unit area.

All liver samples of polar cod, black guillemot and glaucous gull, as well as whole amphipods, were analyzed for fluorinated compounds according to the method described by Berger and Haukås (2005). In short, approximately 1 g of sample homogenate was spiked with 20 ng of internal standard (ISTD) (7H-PFHpA; Table 1), before 3 mL of 2 mM ammonium acetate in methanol:water (1:1, by volume) was added.

Il ciclo dell'acqua è uno dei cicli vitali del sistema Terra ovvero la successione dei fenomeni di flusso e circolazione dell'acqua all'interno dell'idrosfera con i suoi cambiamenti di stato fisico (liquida, aeriforme e solida) ovvero ai continui scambi di massa idrica tra atmosfera e crosta terrestre attraverso le acque superficiali, le acque sotterranee e gli organismi.

Jordens atmosfære er sammensatt av gasser, vanligvis omtalt som luft, som omgir planeten og holdes på plass av jordens tyngdekraft. Atmosfæren beskytter livet på jorden ved å absorbere ultrafiolett solstråling, varme overflaten gjennom varmelagring kjent som drivhuseffekt, og å redusere temperaturforskjellen mellom dag og natt (døgntemperaturvariasjon).
