**Course: 324 Spanish 2-Maggard**

Among a total of 130 patients with 185 pheochromocytomas, Neumann et al. (1993) determined that 43 had von Hippel-Lindau disease, 24 had MEN2, and 63 had sporadic tumors. The patients with familial pheochromocytoma were younger, had multifocal localization much more often, and had cancer more frequently; however, the frequency of extraadrenal tumors was lower in the familial cases.

INTRODUCTION. Normal swallowing requires the coordinated action of muscles of the mouth, pharynx, larynx, and esophagus, which are innervated by the central and peripheral nervous systems(). The swallowing process is generally divided into phases (oral, pharyngeal, and esophageal), which are modified during normal development due to anatomical and physiological maturation().
