Chapter 16 Evolution of Populations Section 16-1 Genes and Variation (pages 393-396) Key Concepts •What are the main sources of heritable variation in a population? •How is evolution defined in genetic terms? •What determines the numbers of phenotypes for a given trait? Introduction (page 393) 1. Is the following sentence true or false?

### Section 16-1 Genes and Variation (pages 393-396)

A population is a group of individuals of the same species that mate and produce offspring. A gene pool consists of all the genes, including all the different alleles for each gene that are present in a population.. Researchers study gene pools by examining the relative frequency of an allele. The relative frequency of an allele is the number of times a particular allele occurs in a gene pool ...

Chapter 16 Evolution of Populations 16-1 Genes and Variation Darwin's original ideas can now be under-stood in genetic terms. Beginning with variation, we now know that traits are controlled by genes and that many genes have at least two forms, or alleles. We also know that individuals of all species are heterozygous for many genes.

### Chapter 16 Evolution of Populations Summary

Example 1: Let's consider a gene with only two alleles. In mice, Black fur color (BB or Bb) is dominant to brown fur color (bb). In a population of 100 mice, 36 mice are homozygous dominant (BB), 48 mice are heterozygous (Bb) and 16 are brown (bb). ... 16.1 Genes and Variation Last modified by:
