My LG HBS-730 headset supports aptX and it has a indirect indication to tell whether the headset is connected with aptX codec. Just press and hold the volume up and down buttons simultaneously for 1 second, this is supposed to switch EQs, but has no effect if aptX is working, although you can still hear the beep sound.

I still feel that testing your specific workload, as per the original answer, is the only way to be sure. It's not an ideal answer when you're trying to tune a production system (so I'd ask if it was possible to get an identical testbed in systems where both performance and availability really matter) but it's the only one I'm really comfortable with.

There are several command line utilities to resolve host names (host, dig, nslookup), however they all use nameservers exclusively, while applications in general look in /etc/hosts first (using gethostbyname I believe). Is there a command line utility to resolve host names that behaves like a usual application, thus looking in /etc/hosts first and only then asking a nameserver?
