What is an example of how prosthetics engineering differs ...

In physics, acceleration is the rate of change of velocity of an object with respect to time. An object's acceleration is the net result of all forces acting on the object, as described by Newton's Second Law. The SI unit for acceleration is metre per second squared ($\text{m}\cdot\text{s}^{-2}$). Accelerations are vector quantities (they have magnitude and direction) and add according to the parallelogram law.

Acceleration - Wikipedia

An inertial frame of reference in classical physics and special relativity is a frame of reference in which a body with zero net force acting upon it is not accelerating; that is, such a body is at rest or is moving at a constant speed in a straight line. In analytical terms, it is a frame of reference that describes time and space homogeneously, isotropically, and in a time-independent manner.

Inertial frame of reference - Wikipedia
