Vector. A vector is formally defined as an element of a vector space. In the commonly encountered vector space (i.e., Euclidean  $n$ -space), a vector is given by coordinates and can be specified as  $\langle x_1, x_2, \dots, x_n \rangle$ . Vectors are sometimes referred to by the number of coordinates they have, so a 2-dimensional vector is often called a two-vector, an  $n$ -dimensional vector is often called an  $n$ -vector, and so on.

A vector space  $V$  is a set that is closed under finite vector addition and scalar multiplication. The basic example is  $n$ -dimensional Euclidean space  $\mathbb{R}^n$ , where every element is represented by a list of  $n$  real numbers, scalars are real numbers, addition is componentwise, and scalar multiplication is multiplication on each term separately. For a general vector space, the scalars are members of a ...

Earlier in Lesson 6, four kinematic equations were introduced and discussed. A useful problem-solving strategy was presented for use with these equations and two examples were given that illustrated the use of the strategy. Then, the application of the kinematic equations and the problem-solving strategy to free-fall motion was discussed and illustrated.
