The history of molecular biology begins in the 1930s with the convergence of various, previously distinct biological and physical disciplines: biochemistry, genetics, microbiology, virology and physics. With the hope of understanding life at its most fundamental level, numerous physicists and chemists also took an interest in what would become molecular biology.

Fluorescence in situ hybridization (FISH) is a molecular cytogenetic technique that uses fluorescent probes that bind to only those parts of a nucleic acid sequence with a high degree of sequence complementarity. It was developed by biomedical researchers in the early 1980s to detect and localize the presence or absence of specific DNA sequences on chromosomes.

(c) Enzymes remain unaltered at the end of a reaction. Once the reaction is brought about, enzymes are ready for another sequence of reactions. (d) Majority of the enzymes are capable of bringing about reversible reactions depending upon the concentration of substrates or products. If the concentration of substrates is more than the concentration of products, the enzyme favors forward reaction.
