Internet Protocol version 4 (IPv4) is the fourth version of the Internet Protocol (IP). It is one of the core protocols of standards-based internetworking methods in the Internet, and was the first version deployed for production in the ARPANET in 1983. It still routes most Internet traffic today, despite the ongoing deployment of a successor protocol, IPv6.

IPv4 - Wikipedia

Nagle's document specified a means of dealing with what he called the small packet problem, created when an application generates data one byte at a time, causing the network to be overloaded with packets (a situation often referred to as send-side silly window syndrome). A single character - one byte of data - originating from a keyboard could result in the transmission of a 41 byte packet ...

Even with wireless encryption enabled, MAC addresses are sent unencrypted. The reason for this is that if you encrypted the MAC address, every client on the wireless network would need to decrypt every single packet, just to find out whether it was sent to them or not. Imagine watching a Netflix movie on your laptop using your home wireless connection, with a smartphone in your pocket also ...
