The source of the changing magnetic fields in MRI may either be the imaging gradients or radiofrequency (RF) coils. The conductive material in which eddy currents are induced may be any metallic component of the MR scanner (other coils, shields, tubes, and housing), wires or devices within or on the patient, and the patient as a whole (in the final analysis, people are just big bags of saline!)

Eddy currents - Questions and Answers in MRI

A typical MR scan may contain over 4 million voxels, each generating its own tiny MR signal. With such a huge array to analyze, how does the scanner possibly sort out where each signal is coming from?

- During your critical thinking processes, there are several pitfalls you might fall into. But you can avoid them. The most common pitfall is jumping to answers too quickly. You think you know what the problem is, and you rush off to solve it. Some of the tools you can use to avoid that pitfall are first: defining your problem well, having that clear problem statement.

An affine transformation is any transformation that preserves collinearity (i.e., all points lying on a line initially still lie on a line after transformation) and ratios of distances (e.g., the midpoint of a line segment remains the midpoint after transformation). In this sense, affine indicates a special class of projective transformations that do not move any objects from the affine space ...

- The final thing you should think about, as you're trying to define your problem, is causality. I've mentioned thinking about causes and consequences. That applies to thinking through how you're going to define the problem in the first place. You should understand, are some elements of the problem you're trying to solve derived from other problems, or other related elements?
