R.Wayne Albers, ... George J. Siegel, in Basic Neurochemistry (Eighth Edition), 2012 This chapter deals with membrane transport subserved by membrane-embedded proteins that convey solutes in and out of the cell and thusly regulate the intercellular milieu. In primary active transport, the transporters utilize chemical bond energy from hydrolysis of the terminal phosphate of ATP.

Sediment transport is the movement of solid particles (), typically due to a combination of gravity acting on the sediment, and/or the movement of the fluid in which the sediment is entrained. Sediment transport occurs in natural systems where the particles are clastic rocks (sand, gravel, boulders, etc.), mud, or clay; the fluid is air, water, or ice; and the force of gravity acts to move the ...

The changing distance separating the Moon and Earth also affects tide heights. When the Moon is closest, at perigee, the range increases, and when it is at apogee, the range shrinks. Every 7 1/2 lunations (the full cycles from full moon to new to full), perigee coincides with either a new or full moon causing perigean spring tides with the largest tidal range.

A heat flux or thermal flux is the amount of heat energy passing through a certain surface. In a clothing system a heat flux sensor can provide information on the heat exchange between the body and the environment and thus give direct input to improve the thermal comfort of the garment. Gidik et al. (2015) developed a textile-based heat flow sensor by weaving a thermoelectric (TE) wire into a ...

It may be frustrating to hear "it depends" when one asks how a spill of diluted bitumen will behave. But just like whether you wore a coat this morning "depended" on the temperature, or if it was raining, and conversely, your tolerance to cold and rain, the same with oil spills: their behavior depends on environmental factors, and the type of oil.
