Amplicon-based sequencing is the most common strategy used to construct community profiles of skin microbiota. This method has been extensively used to characterize bacterial communities by targeting the highly conserved 16S ribosomal RNA (rRNA) gene, which contains hypervariable regions that are widely divergent among different bacterial taxa (Lane et al., 1985).

DNA is a long polymer made from repeating units called nucleotides. The structure of DNA is dynamic along its length, being capable of coiling into tight loops and other shapes. In all species it is composed of two helical chains, bound to each other by hydrogen bonds. Both chains are coiled around the same axis, and have the same pitch of 34 angstroms (Å) (3.4 nanometres).
