A chemical formula is a way of presenting information about the chemical proportions of atoms that constitute a particular chemical compound or molecule, using chemical element symbols, numbers, and sometimes also other symbols, such as parentheses, dashes, brackets, commas and plus (+) and minus (−) signs. These are limited to a single typographic line of symbols, which may include ...

Chemical formula - Wikipedia

In a chemical reaction, one or more reactants are transformed into products: reactants → products. The purpose of a chemical equation is to express this relation in terms of the formulas of the actual reactants and products that define a particular chemical change. For example, the reaction of mercury with oxygen to produce mercuric oxide would be expressed by the equation

Chemical Equations and Calculations

Sometimes students treat an equation like a black box. You plug in the numbers and – hey presto! – out comes the answer. But if you're going for a top grade, you need to think carefully about the meaning of the equation and how its variables are related to one another.
