Antimicrobial resistance (AMR or AR) is the ability of a microbe to resist the effects of medication that once could successfully treat the microbe. The term antibiotic resistance (AR or ABR) is a subset of AMR, as it applies only to bacteria becoming resistant to antibiotics. Resistant microbes are more difficult to treat, requiring alternative medications or higher doses of antimicrobials.

Simon et al. (1997) demonstrated that the intron-exon organization of the CLCNKA and CLCNKB genes was identical, with each channel encoded by 19 exons. Overall, the genes show 94% DNA sequence identity in exons. The 2 genes are transcribed from the same DNA strand, with CLCNKA 5-prime of CLCNKB.

See 103700 for evidence on the mapping of the ADH1B gene in the cluster of related genes on chromosome 4q22.. As outlined by Osier et al. (2002), 7 ADH genes are clustered in a region of approximately 380 kb on chromosome 4q21-q23. The class I ADH genes are situated in a tighter cluster of approximately 77 kb, in the following order: ADH1C, ADH1B, and ADH1A.

Heritability allows a comparison of the relative importance of genes and environment to the variation of traits within and across populations.

Heritability in the genomics era — concepts and ...

Evolution is change in the heritable characteristics of biological populations over successive generations. These characteristics are the expressions of genes that are passed on from parent to offspring during reproduction. Different characteristics tend to exist within any given population as a result of mutation, genetic recombination and other sources of genetic variation.

<https://en.wikipedia.org> Cdk/cyclin complexes regulate Rb/E2F- and FoxM1-mediated transcription. During the G1 phase of the cell cycle, Cdk4/cyclin D (cycD) and Cdk2/cyclin E (cycE) complexes sequentially phosphorylate (P) Rb, leading to the activation of E2F proteins and the expression of E2F-responsive genes.
