Trigonometry in the modern sense began with the Greeks. Hipparchus (c. 190–120 bce) was the first to construct a table of values for a trigonometric function. He considered every triangle—planar or spherical—as being inscribed in a circle, so that each side becomes a chord (that is, a straight line that connects two points on a curve or surface, as shown by the inscribed triangle ABC in ...

MOTIVATION. In the module, Further Trigonometry, we saw how to use points on the unit circle to extend the definition of the trigonometric ratios to include obtuse angles. That same construction can be extended to angles between  $180^\circ$  and  $360^\circ$  and beyond. The sine, cosine and tangent of negative angles can be defined as well.

A right triangle is triangle with an angle of 90 degrees ( $\pi/2$  radians). The sides  $a$ ,  $b$ , and  $c$  of such a triangle satisfy the Pythagorean theorem  $a^2 + b^2 = c^2$ , (1) where the largest side is conventionally denoted  $c$  and is called the hypotenuse. The other two sides of lengths  $a$  and  $b$  are called legs, or sometimes catheti. The favorite A-level math exam question of the protagonist Christopher in ...
