Nucleate boiling is a type of boiling that takes place when the surface temperature is hotter than the saturated fluid temperature by a certain amount but where the heat flux is below the critical heat flux. For water, as shown in the graph below, nucleate boiling occurs when the surface temperature is higher than the saturation temperature (T_s) by between 10°C (18°F) to 30°C (54°F).

Capillary driven heat pipes have been investigated for range of thermal control applications in the automotive sector [22,23]. A heat pipe can transfer heat at orders of magnitude higher than a similar size of solid metal rod, without the use of moving parts [, ,]. For electronic devices such as LED headlamps and LCD displays, heat pipes can be invariably used to transfer, spread and dissipate ...

La temperatura a la cual el efecto Leidenfrost comienza a ocurrir no es fácil de predecir. Incluso si el volumen de la gota de líquido permanece igual, el punto Leidenfrost puede ser bastante diferente, con una dependencia complicada en las propiedades de la superficie, así como cualesquiera impurezas en el líquido.
