### T Test Examples And Solutions

The one sample t-test is a statistical procedure used to determine whether a sample of observations could have been generated by a process with a specific mean. Suppose you are interested in determining whether an assembly line produces laptop computers that weigh five pounds. To test this hypothesis, you could collect a sample of laptop computers from the assembly line, measure their weights ...

Example homework problem: Our t test will have df equal to the total of our sample sizes minus 2. In our case, we have 10 participants in each group, so we would have  $df = n_1 + n_2 - 2 = 10 + 10 - 2 = 18$ . Alpha was set at .05 and we will conduct a two- tailed test. When you consult your table of critical values for t,...

For the t-test, subtract the mean of the comparison group from the mean of the treatment group and divide the difference by the standard deviation of the comparison group. For this example, the effect size is calculated as: which is considered to be a large effect. /\* Spss Code for T-test of independent groups \*/ data list / group 1-1 scr 3-4 .

Solutions to T Test Problems Problem #1. You'll run a t test for independent samples. It doesn't matter that the number of animals in each data set is the same, nor that they are all the same type of animal. You sampled 12 treated individuals and 12 different untreated individuals. There is no special relationship between a data point from one group and any particular data point from a second.

Example homework problem: Compute test statistic. Compute the mean and standard deviation of your sample. You will find that the mean is equal to 29.00 and the standard deviation is equal to 2.78. Now, compute your t statistic: Conduct hypothesis test. The degrees of freedom ( df) for your test is equal to  $n - 1$ .

The t test (also called Student's T Test) compares two averages and tells you if they are different from each other. The t test also tells you how significant the differences are; In other words it lets you know if those differences could have happened by chance.. A very simple example: Let's say you have a cold and you try a naturopathic remedy.

The one-sample t test requires the following statistical assumptions: 1. Random and Independent sampling. 2. Data are from normally distributed populations. Note: The one-sample t test is generally considered robust against violation of this assumption once  $N > 30$ .
