Genetics is a branch of biology concerned with the study of genes, genetic variation, and heredity in organisms.. Gregor Mendel, a scientist and Augustinian friar, discovered genetics in the late 19th-century. Mendel studied "trait inheritance", patterns in the way traits are handed down from parents to offspring. He observed that organisms (pea plants) inherit traits by way of discrete "units ...

The Annual Review of Genetics, in publication since 1967, covers significant developments in the field of genetics. These include biochemical, behavioral, cell, and developmental genetics; evolutionary and population genetics; chromosome structure and transmission; gene function and expression; mutation and repair; genomics; immunogenetics; and other topics as related to the genetics of viruses ...

Behavioural genetics, also referred to as behaviour genetics, is a field of scientific research that uses genetic methods to investigate the nature and origins of individual differences in behaviour. While the name "behavioural genetics" connotes a focus on genetic influences, the field broadly investigates genetic and environmental influences, using research designs that allow removal of the ...

The Biology Project, an interactive online resource for learning biology developed at The University of Arizona. The Biology Project is fun, richly illustrated, and tested on 1000s of students. It has been designed for biology students at the college and high school level, but is useful for medical students, physicians, science writers, and all types of interested people.

Introduction. Uric acid is one of the most important nitrogen compounds in animal and plant bodies. It consists of 2,6,8 trihydroxypurine existing as a keto-enol tautomerism that under physiological conditions can easily be converted to the corresponding urate. It derived from purine, two of which, adenine and guanine, are present in DNA and RNA.

Genetics is the study of heredity and variation in organisms. We begin with a study of the monohybrid cross, invented by Mendel. In a monohybrid cross, organisms differing in only one trait are crossed.

The purpose of this review is threefold: (1) provide an overview of the current state of knowledge in human chronic pain genetics, (2) highlight relevant genetic studies and their outcomes for each pathology category, and (3) summarize the genomically-derived mechanisms of molecular pathophysiology for each category.

Individual variation. Salmon and Blakeslee (1935) measured the PTC threshold of 12 people repeatedly over a period of several days. Each subject had different thresholds at different times; in the most extreme case, one person sometimes had a threshold of 0.4 mM while another time had a threshold of 100 mM.

Genetics - Methods in genetics: Genetically diverse lines of organisms can be crossed in such a way to produce different combinations of alleles in one line. For example, parental lines are crossed, producing an F1 generation, which is then allowed to undergo random mating to produce offspring that have purebreeding genotypes (i.e., AA, bb, cc, or DD).

x DNA-based genotyping has been used successfully in human identification [1]. Efficient protocols for obtaining DNA suitable for genotyping from exhumed bone samples are in continuous development [2-15]. In 2013, we reported an alternative method to obtain high quality STR profiles from small amounts of bone samples (<200 mg/sample), processed as powder and slices of bone [16].
