5. Dimension 3 DISCIPLINARY CORE IDEAS—PHYSICAL SCIENCES. Most systems or processes depend at some level on physical and chemical subprocesses that occur within it, whether the system in question is a star, Earth's atmosphere, a river, a bicycle, the human brain, or a living cell. Large-scale systems often have emergent properties that cannot be explained on the basis of atomic-scale ...

Energy. Energy is an abstract concept that requires lots of discussion with students about physical observations and their interpretation. We begin with simple experiments that introduce the language of energy, and go on to include more advanced topics such as the energy shared amongst the particles of matter - the internal energy in hot objects, often called 'heat'.

When an earthquake occurs, the shockwaves of released energy that shake the Earth and temporarily turn soft deposits, such as clay, into jelly (liquefaction) are called seismic waves, from the Greek 'seismos' meaning 'earthquake'. Seismic waves are usually generated by movements of the Earth's tectonic plates but may also be caused by explosions, volcanoes and landslides.

Electromotive force, abbreviated emf (denoted and measured in volts), is the electrical action produced by a non-electrical source. A device that converts other forms of energy into electrical energy (a "transducer"), such as a battery (converting chemical energy) or generator (converting mechanical energy), provides an emf as its output. Sometimes an analogy to water "pressure" is used to ...
