Weathering is the breaking down of rocks, soil, and minerals as well as wood and artificial materials through contact with the Earth's atmosphere, water, and biological organisms. Weathering occurs in situ (on site), that is, in the same place, with little or no movement, and thus should not be confused with erosion, which involves the movement of rocks and minerals by agents such as water, ice ...

WHAT FACTORS AFFECT EROSION AND DEPOSITION BY SURFACE WATER?. When surface water (runoff and streams) flows, it might carry or erode lots of sediments, or very few, or it might do deposition. It will depend on many different factors such as the slope of the ground, the type of ground surface, or the weather.

5.2 Weathering and Erosion. Bedrock refers to the solid crystalline rock that makes up the Earth's outer crust. Weathering is a process that turns bedrock into smaller particles, called sediment or soil. Mechanical weathering includes pressure expansion, frost wedging, root wedging, and salt expansion. Chemical weathering includes carbonic acid and hydrolysis, dissolution, and oxidation.
