Varignon's theorem is a statement in Euclidean geometry, that deals with the construction of a particular parallelogram, the Varignon parallelogram, from an arbitrary quadrilateral (quadrangle). It is named after Pierre Varignon, who published it in 1731.

Varignon's theorem - Wikipedia

A parallelogram is a quadrilateral with opposite sides parallel (and therefore opposite angles equal). A quadrilateral with equal sides is called a rhombus, and a parallelogram whose angles are all right angles is called a rectangle. And, since a square is a degenerate case of a rectangle, both squares and rectangles are special types of parallelograms.

Quadrilaterals. In other modules, we defined a quadrilateral to be a closed plane figure bounded by four intervals, and a convex quadrilateral to be a quadrilateral in which each interior angle is less than 180° . We proved two important theorems about the angles of a quadrilateral: The sum of the interior angles of a quadrilateral is 360° .

A right trapezoid (also called right-angled trapezoid) has two adjacent right angles. Right trapezoids are used in the trapezoidal rule for estimating areas under a curve.. An acute trapezoid has two adjacent acute angles on its longer base edge, while an obtuse trapezoid has one acute and one obtuse angle on each base.. An isosceles trapezoid is a trapezoid where the sides (legs) have the ...

The area of a 2D shape is the amount of space it takes up in 2 dimensions, and its units are always squared, e.g cm^2 , mm^2 , and so on. You should know how to calculate the areas of the following four shapes: rectangles, triangles, parallelograms, and trapezia. The formulae you need for these four shapes are shown below.
