The immune system is a host defense system comprising many biological structures and processes within an organism that protects against disease. To function properly, an immune system must detect a wide variety of agents, known as pathogens, from viruses to parasitic worms, and distinguish them from the organism's own healthy tissue. In many species, the immune system can be classified into ...

Tissue Membranes. A tissue membrane is a thin layer or sheet of cells that covers the outside of the body (for example, skin), the organs (for example, pericardium), internal passageways that lead to the exterior of the body (for example, abdominal mesenteries), and the lining of the moveable joint cavities. There are two basic types of tissue membranes: connective tissue and epithelial ...

Fig. 2, based on an excellent review of data from patients with deficits in phonological STM by Vallar and Papagno (2002), gives a somewhat more detailed specification of the phonological loop model. With auditory presentation, the speech stream is analyzed and then fed into a phonological storage system. It may then be fed into the articulatory control system, either for direct recall, or ...
