Vector Addition Word Problems 1

In mathematics, physics, and engineering, a Euclidean vector (sometimes called a geometric or spatial vector, or—as here—simply a vector) is a geometric object that has magnitude (or length) and direction. Vectors can be added to other vectors according to vector algebra. A Euclidean vector is frequently represented by a line segment with a definite direction, or graphically as an arrow ...

A vector space (also called a linear space) is a collection of objects called vectors, which may be added together and multiplied ("scaled") by numbers, called scalars. Scalars are often taken to be real numbers, but there are also vector spaces with scalar multiplication by complex numbers, rational numbers, or generally any field. The operations of vector addition and scalar multiplication ...

Word Embeddings. A word embedding is an approach to provide a dense vector representation of words that capture something about their meaning. Word embeddings are an improvement over simpler bag-of-word model word encoding schemes like word counts and frequencies that result in large and sparse vectors (mostly 0 values) that describe documents but not the meaning of the words.

The main problem with the above is that you can lose some pixel data from the image. That is the pixels are not 'swapped' but randomly copied, which means a specific pixel in the image may become duplicated or lost.

Hello Pavel, yes, there is a way. First, you must detect phrases in the text (such as 2-word phrases). Then you build the word2vec model like you normally would, except some "tokens" will be strings of multiple words instead of one (example sentence: ["New York", "was", "founded", "16th century"]).

Then, you apply some method for matrix dimensionality reduction such as Singular-Value Decomposition and voilà, each row of your matrix is a word vector. In case you are wondering what is a dimensionality reduction: when there's redundant data in a matrix you can generate a smaller one with almost the same information.
