Generally, an acid-base titration involves using a buret to slowly add a basic (or acidic) solution with a known concentration to a flask containing an acidic (or basic) solution of unknown concentration. The solution added with the buret is called the titrant and we will call the solution it is added to the analyte.

Lab #14A - Acid-Base Titrations. This method utilizes the fact that when the acid is half-neutralized, concentration of the weak acid (HA) equals the concentration of the conjugate base on the product side. In other words, $[\text{HA}] = [\text{A}^-]$. So these terms cancel in the above equation. That leaves $K_a = \frac{[\text{H}_3\text{O}^+]}{[\text{HA}]}$.
