### 11.2 Types of Chemical Reactions Flashcards | Quizlet

A chemical reaction is a process generally characterized by a chemical change in which the starting materials (reactants) are different from the products. Chemical reactions tend to involve the motion of electrons, leading to the formation and breaking of chemical bonds. There are several different types of chemical reactions and more than one way of classifying them.

### 12 types of chemical reactions - SlideShare

The five general types of reaction are combination, decomposition, single-replacement, double-replacement, and combustion. Not all chemical reactions fit uniquely into only one category. Occasionally, a reaction may fit equally well into two categories. Nevertheless, recognizing a reaction as a particular type is useful.

2) Decomposition Reactions • This is a chemical change where a single compound (the reactant) breaks down into two or more simpler products. • This type of reaction is easily identifiable, because: • It is the exact opposite of synthesis; if you know one you know them both • There is always one reactant. If you see one reactant

### The 5 Types of Chemical Reactions (Chapter 11)

Chemical equations are used to graphically illustrate chemical reactions. They consist of chemical or structural formulas of the reactants on the left and those of the products on the right. They are separated by an arrow ( $\rightarrow$ ) which indicates the direction and type of the reaction; the arrow is read as the word "yields". The tip of the arrow points in the direction in which the reaction proceeds.
