Abstract algebra is the set of advanced topics of algebra that deal with abstract algebraic structures rather than the usual number systems. The most important of these structures are groups, rings, and fields. Important branches of abstract algebra are commutative algebra, representation theory, and homological algebra. Linear algebra, elementary number theory, and discrete mathematics are ...

In mathematics, and specifically in abstract algebra, an integral domain is a nonzero commutative ring in which the product of any two nonzero elements is nonzero. Integral domains are generalizations of the ring of integers and provide a natural setting for studying divisibility. In an integral domain, every nonzero element  $a$  has the cancellation property, that is, if  $a \neq 0$ , an equality  $ab = ac$  ...

This talk was given by Elizabeth Kelley at our student combinatorics seminar. She cited Godbole, Kurtz, Pralat, and Zhang as collaborators. One of these (Pralat, I think) was originally an editor, but then made substantial contributions to the project.

In physics, string theory is a theoretical framework in which the point-like particles of particle physics are replaced by one-dimensional objects called strings. It describes how these strings propagate through space and interact with each other. On distance scales larger than the string scale, a string looks just like an ordinary particle, with its mass, charge, and other properties ...

En mathématiques, le théorème fondamental de l'algèbre, aussi appelé théorème de d'Alembert-Gauss et théorème de d'Alembert, indique que tout polynôme non constant, à coefficients complexes, admet au moins une racine. En conséquence, tout polynôme à coefficients entiers, rationnels ou encore réels admet au moins une racine complexe, car ces nombres sont aussi des complexes.
