Virus Concept Map Answers

A computer virus is a program, script, or macro designed to cause damage, steal personal information, modify data, send e-mail, display messages, or some combination of these actions.. When the virus is executed, it spreads by copying itself into or over data files, programs, or boot sector of a computer's hard drive, or potentially anything else writable.

When talking about investments, having control over your funds is a critical factor in entering a venture. Daicore has developed a one-of-a-kind system which allows you to fully control your funds even after you invested in an ICO, meaning that you can retire anytime from any project that is not heading in the right direction.

Control your ICO investments

You don't gain much by including the other interfaces because almost all of the built-in value types implement all of those interfaces. This is especially true for constraints on a generic extension method, which is extremely handy for operating on enums, except for the fact that those extension methods are like a virus that infects all your objects.
